Per-target (m_θ, b_θ) bounds vs. proved bound (Theorem 10.9)
$\log_2 3$
$d \le 0.45 \log_2(e+o) + 1.9$ $(\theta = \log_2 3)$
ϕ
$d \le 0.72 \log_2(e+o) - 0.6$ $(\theta = \phi)$
proved bound: $d \le \frac{2}{\log_2 3} \log_2(e+o) + 2$ (Thm. 10.9)
conjectured bound: $d \le \frac{2}{\log_2(10/3)} \log_2(e+o) + 3$ (Conj.)
Depth d
$\log_2(e+o)$
